

Python File Handling

Short & Practical Revision Notes

1. Opening a File

```
open("filename", "mode")
```

2. File Modes

```
r → Read  
w → Write / Overwrite  
a → Append  
x → Create  
b → Binary  
t → Text
```

3. Writing

```
f = open("student.txt", "w")  
f.write("Harsh Patel\n")  
f.close()
```

4. writelines()

```
students = ["Harsh\n", "Raviraj\n", "Jeel\n"]  
f.writelines(students)
```

5. Reading

```
f = open("student.txt", "r")  
data = f.read()  
print(data)  
f.close()
```

6. readline()

Reads **ONE line** at a time.

7. readlines()

Reads all lines and returns a **LIST**.

8. Reading with Loop

```
with open("student.txt", "r") as f:  
    for line in f:  
        print(line, end="")
```

9. Append

```
with open("student.txt", "a") as f:  
    f.write("Bansari Patel\n")
```

10. tell()

Returns the current file cursor position.

11. seek()

Moves the file cursor.
seek(0) → Beginning

12. with open()

Automatically closes the file after the block finishes.

13. Check File

```
import os  
if os.path.exists("student.txt"):  
    print("File exists")
```

14. Delete File

```
os.remove("student.txt")
```

15. Error Handling

```
try:
    with open("abc.txt", "r") as f:
        print(f.read())
except FileNotFoundError:
    print("File not found!")
```

16. CSV File

```
import csv

with open("students.csv", "w", newline="") as f:
    writer = csv.writer(f)
    writer.writerow(["Name", "Age"])
    writer.writerow(["Harsh", 22])
```

Quick Revision

Function	Use
write()	Write one string
writelines()	Write multiple strings
read()	Read complete file
readline()	Read one line
readlines()	Read all lines as a list
tell()	Current cursor position
seek()	Move cursor
close()	Close file
with open()	Automatically closes file
